

Some formulae for norms of elementary operators

Richard Timoney, Trinity College Dublin, Ireland

We present a formula for the norm of an elementary operator on a C^* -algebra that seems to be new. The formula involves (matrix) numerical ranges and a kind of geometrical mean for positive matrices, the tracial geometric mean, which seems not to have been studied previously and has interesting properties. The talk will focus on the properties of the tracial geometric mean more than on the elementary operators.
